APPENDIX I: MASS TRANSITIONS	8
APPENDIX II: VALIDATION RESULTS	11

1. Aim and scope

This report describes a validation data of 86 pesticides using a multiresidue method by LC-MS/MS and GC-MS/MS in green tea, red tea, black tea and chamomile.

2. Short description

Homogenous sample is extracted with acetonitrile according to modified QuEChERS protocol. The obtained extract is analysed by GC-MS/MS and LC-MS/MS.

3. Apparatus and consumables

- Automatic pipettes, suitable for handling volumes of 30 µL to 500 µL and 1 mL to 3 mL.
- 50 ml PTFE centrifuge tubes with screw caps
- 15 ml PTFE centrifuge tubes with screw caps
- Vortex
- Automatic axial extractor
- Centrifuge, suitable for the centrifuge tubes employed in the procedure and capable of achieving at least 3700 rpm
- Concentration workstation
- Syringes, e.g. 2 mL disposable syringes
- Syringe filters, 0.45 µm pore size
- Injection vials, 2 ml, suitable for LC and GC auto-sampler
- Volumetric flasks
- Primary secondary amine bonded silica (PSA), bulk material

4. Chemicals

- Acetonitrile ultra-gradient grade
- Formic acid
- Trisodium citrate dihydrate
- Sodium chloride
- Disodium hydrogencitrate sesquihydrate
- Calcium chloride
- Anhydrous magnesium sulphate
- Ultra-pure water
- Ethyl acetate HPLC grade
- Pesticides standards

5. Procedure

5.1. Sample preparation

To obtain representative subsamples, samples should be frozen overnight and after that minced.

5.2. Recovery experiments for method validation

The samples employed in validation studies did not contain any of the pesticides analysed.

Individual pesticide stock solutions (1000–2000 mg/L) were prepared in acetonitrile and ethyl acetate and were stored in amber screw-capped glass vials in the dark at -20 °C.

For spiking, 15 g representative portions of previously homogenised tea/chamomile were weighed and transferred to a crystalliser, where they were fortified homogenously with 15 mL of the working standard solution in methanol.

The validation method was performed at four fortification levels (0.010 mg/Kg, 0.025 mg/Kg, 0.050 mg/Kg and 0.100 mg/Kg). Five replicates were analysed at each level.

5.3. Extraction

1. Weigh 2 g ± 0.1 g of sample in 50 mL PTFE centrifuge tube.
2. Add 4 mL of ultra-pure water, shake in a vortex 30 s and leave for 30 minutes.
3. Add 10 mL of acetonitrile and 200 µL of 25 mg/L triphenyl phosphate (TPP, internal surrogate standard)
4. Shake in automatic axial extractor for 7 minutes.
5. Add 4 g of magnesium sulphate, 1 g of sodium chloride, 1 g of trisodiumcitrate dehydrate and 0.5 g of disodium hydrogencitrate sesquihydrate.
6. Shake in automatic axial extractor for 7 minutes.
7. Centrifuge for 5 min at 3700 rpm.
8. Transfer 3 mL of supernatant into 15 mL PTFE centrifuge tube containing 150 mg of PSA and 150 mg of calcium chloride and shake in a vortex 30 s.
9. Centrifuge for 5 min at 3700 rpm.
10. Add to the extract 30 µL of 5% formic acid in acetonitrile.
11. Evaporate an aliquot under gentle stream of nitrogen and reconstitute:
 - a. for LC analysis with acetonitrile:water (10:90 v/v) and filter the sample thorough 0.45 µm PTFE filter

b. for GC analysis with ethyl acetate.

With this treatment, 1 mL of sample extract represents 0.2 g of sample.

5.4. Measurement

Both LC and GC systems were operated in multiple reaction monitoring mode (MRM). Selected reaction monitoring (SRM) experiments were carried out to obtain the maximum sensitivity for the detection of the target molecules. For confirmation of the studied compounds, two SRM transitions and a correct ratio between the abundances of the two optimised SRM transitions (SRM2/SRM1) were used, along with retention time matching. The mass transitions used are presented in Appendix I.

5.5. Instrumentation and analytical conditions for the LC- MS/MS system

5.5.1. Agilent 1200 HPLC

- Column: Agilent Zorbax SB, C8, 4.6 mm x 150 mm x 5 µm
- Mobile phase A: acetonitrile
- Mobile phase B: 0.1% formic acid in ultra-pure water
- Flow rate: 0.6 mL/min
- Injection volume: 10 µL

Mobile phase gradient for pesticides analyse in positive mode

Time [min]	Mobile phase A	Mobile phase B
0	30%	70%
3	30%	70%
5	50%	50%
21	100%	0%
24	100%	0%

Re-equilibration with initial mobile phase: 7 minutes.

Mobile phase gradient for pesticides analyse in negative mode

Time [min]	Mobile phase A	Mobile phase B
0	60%	40%
3	60%	40%
6	80%	20%
8	100%	0%
11	100%	0%

Re-equilibration with initial mobile phase: 7 minutes.

5.5.2. Agilent 6410 QqQ MS/MS

- ESI source gas temperature: 300 °C
- Gas flow: 9 L/min
- Nebuliser gas: nitrogen
- Nebuliser gas pressure: 40 psi
- Capillary voltage in positive mode: 4000 V
- Capillary voltage in negative mode: -4000 V
- Collision gas: nitrogen

5.6. Instrumentation and analytical conditions for the GC- MS/MS system

5.6.1. Agilent 7890

- Column: HP-5MS UI 15 m × 0.25 mm × 0.25 µm
- Retention Time Locking compound: trifluralin (retention time 5.81 min)
- Injection mode: splitless
- Ultra inert inlet liner, with a glass wool frit from Agilent
- Injection volume: 2 µl
- Injector temperature:

Time [min]	Temperature	
0	80 °C	solvent evaporation
0.1	80 °C	
0.6	300 °C	
20	300 °C	

- Carrier gas: helium
- Carrier gas purity: 99.999%
- Carrier gas pressure: constant, 14.194 psi
- Quenching gas: helium
- Oven temperature: 70°C for 1 min, programmed to 150°C at 50°C/min, then to 200°C at 6°C/min and finally to 280°C at 16°C/min (4.07 min). The total run time was 20 minutes with 3 additional minutes for backflushing at 280°C.

5.6.2. Agilent 7000 QqQ MS/MS

- Ionisation mode: electron impact ionisation
- Temperature of the transfer line: 280 °C
- Temperature of ion source: 280 °C
- Temperature of quadrupole 1 and 2: 150 °C
- Collision gas: nitrogen
- Collision gas purity: 99.999%
- Solvent delay: 2 minutes

6. Validation of the method

6.1. Recoveries and within-laboratory reproducibility

The results corresponding to the mean recovery ($n=5$) and within-laboratory reproducibility in terms of relative standard deviation (RSD) at both fortification levels are summarized in Appendix II.

6.2. Limits of quantitation

Document N° SANCO/12495/2011 defines limit of quantitation as the lowest validated spike level meeting the method performance acceptability criteria. Due to the high complexity of the matrices and considering the good repeatability of the method, we accepted those recoveries in the range 60–140%, which is the range proposed by the guideline for routine analysis working with multiresidue methods. LOQs are summarized in Appendix II.

6.3. Limits of detection

The analytical limit of detection (LOD) for each pesticide was determined as the minimum concentration of analyte providing a spectrum in which the qualifier selected reaction monitoring (SRM2) transition had a signal-to-noise ratio (S/N) of 3. LODs are summarized in Appendix II.

6.4. Linearity

Linearity of the (QqQ)MS systems was evaluated by assessing the signal responses of the target analytes from matrix-matched calibration solutions prepared by spiking blank extracts at seven concentration levels, from 0.5 to 200 µg/L, which correspond in the sample to 2.5 to 1000 µg/kg given the 5-times dilution factor. In almost all cases, coefficient of determination (r^2) was higher than 0.99. Linearity ranges for all pesticides in all matrices are summarized in Appendix II.

6.5. Matrix effects

Matrix effects were assessed by comparison of the slopes of seven-point matrix-matched calibration curves with the slopes of the calibration curves in solvent. Values of matrix effects are summarized in Appendix II.

This report aims to provide information to laboratories that analyse pesticide residues in green tea, red tea, black tea and chamomile or are interested in it.

^b Analysed by GC-MS/MS

Table 4. Limits of detection, limits of quantification, concentration range and matrix effects for the selected matrices studied. Negative values of matrix effects mean suppression of the signal, and positive values, enhancement. LOD and LOQ are referred to the concentration in the sample and instrumental concentration range to the final extract which is diluted 5 times.

Compound	LOD ($\mu\text{g/kg}$)				LOQ ($\mu\text{g/kg}$)				Instrumental concentration range ($\mu\text{g/L}$)				ME(%) = ((slope matrix/slope solvent)-1) $\times 100$
