Calculation of assigned values and uncertainty of assigned values

- Algorithm A mean of the results from EU laboratories (and EFTA)
 - Only result from participant that
 - Reported to add water to the samples before extraction or
 - used mixture of solvent and water or
 - used ASE
- Outliers
 - Only obvious uncorrect results
- Uncertainty
 - $u=1.25 * (s^* / \sqrt{n})$
 - s^* is robust standard deviation (Alg A standard deviation)
 - N is the number of participants

Calculations of z-scores

- For each laboratory/pesticide combination :

$$z = (x - \bar{x}) / \sigma$$

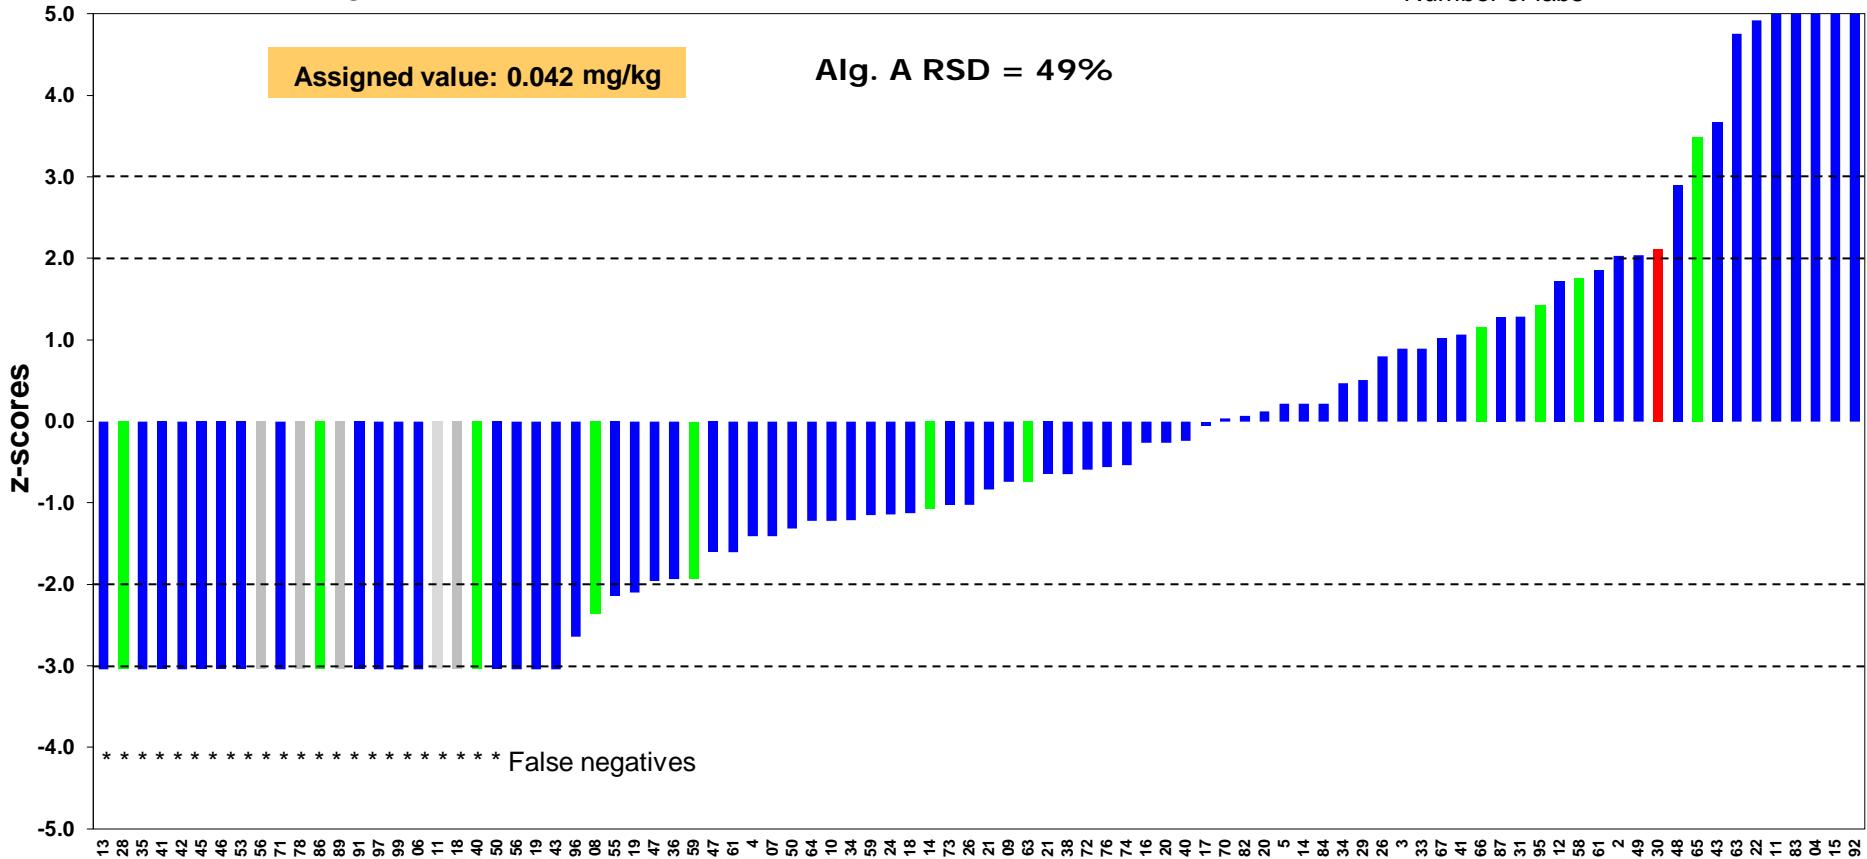

- x is the result reported by the participant or the specific reporting limit of the lab for those labs not having detected the pesticide present in the test material
 - X is the assigned value, Alg A mean without outliers
 - σ is the target standard deviation obtained by multiplying the median by the FFP RSD of 25%

- $|z| \leq 2$ Acceptable
 - $2 < |z| \leq 3$ Questionable

- To be classified as Category A laboratory the labs had to report at least 90% of the pesticide present in the test material (≥ 17 pesticide residues) and report no false positive.
- Evaluation of the overall performance, the Average of the Squared z-Score (AZ2) are calculated:

$$AZ^2 = \frac{\sum_{i=1}^n Z_i^2}{n}$$

- $z \leq 2$ Good
- $2 < z \leq 3$ Satisfactory
- $z > 3$ Unsatisfactory
