# Incurred Compounds

**20 LC<sup>a</sup>- and GC<sup>b</sup>- amenable pesticides**

15 pesticides evaluated

- Acetamiprid
- Buprofezin
- Carbendazim
- Chlorpyrifos
- Cypermethrin
- Difenoconazole
- Endosulfan beta
- Ethofenprox
- Fenpropathrin
- Imidacloprid
- Lambda cyhalothrin
- Methomyl
- Parathion ethyl
- Pyridaben
- Tebuconazole

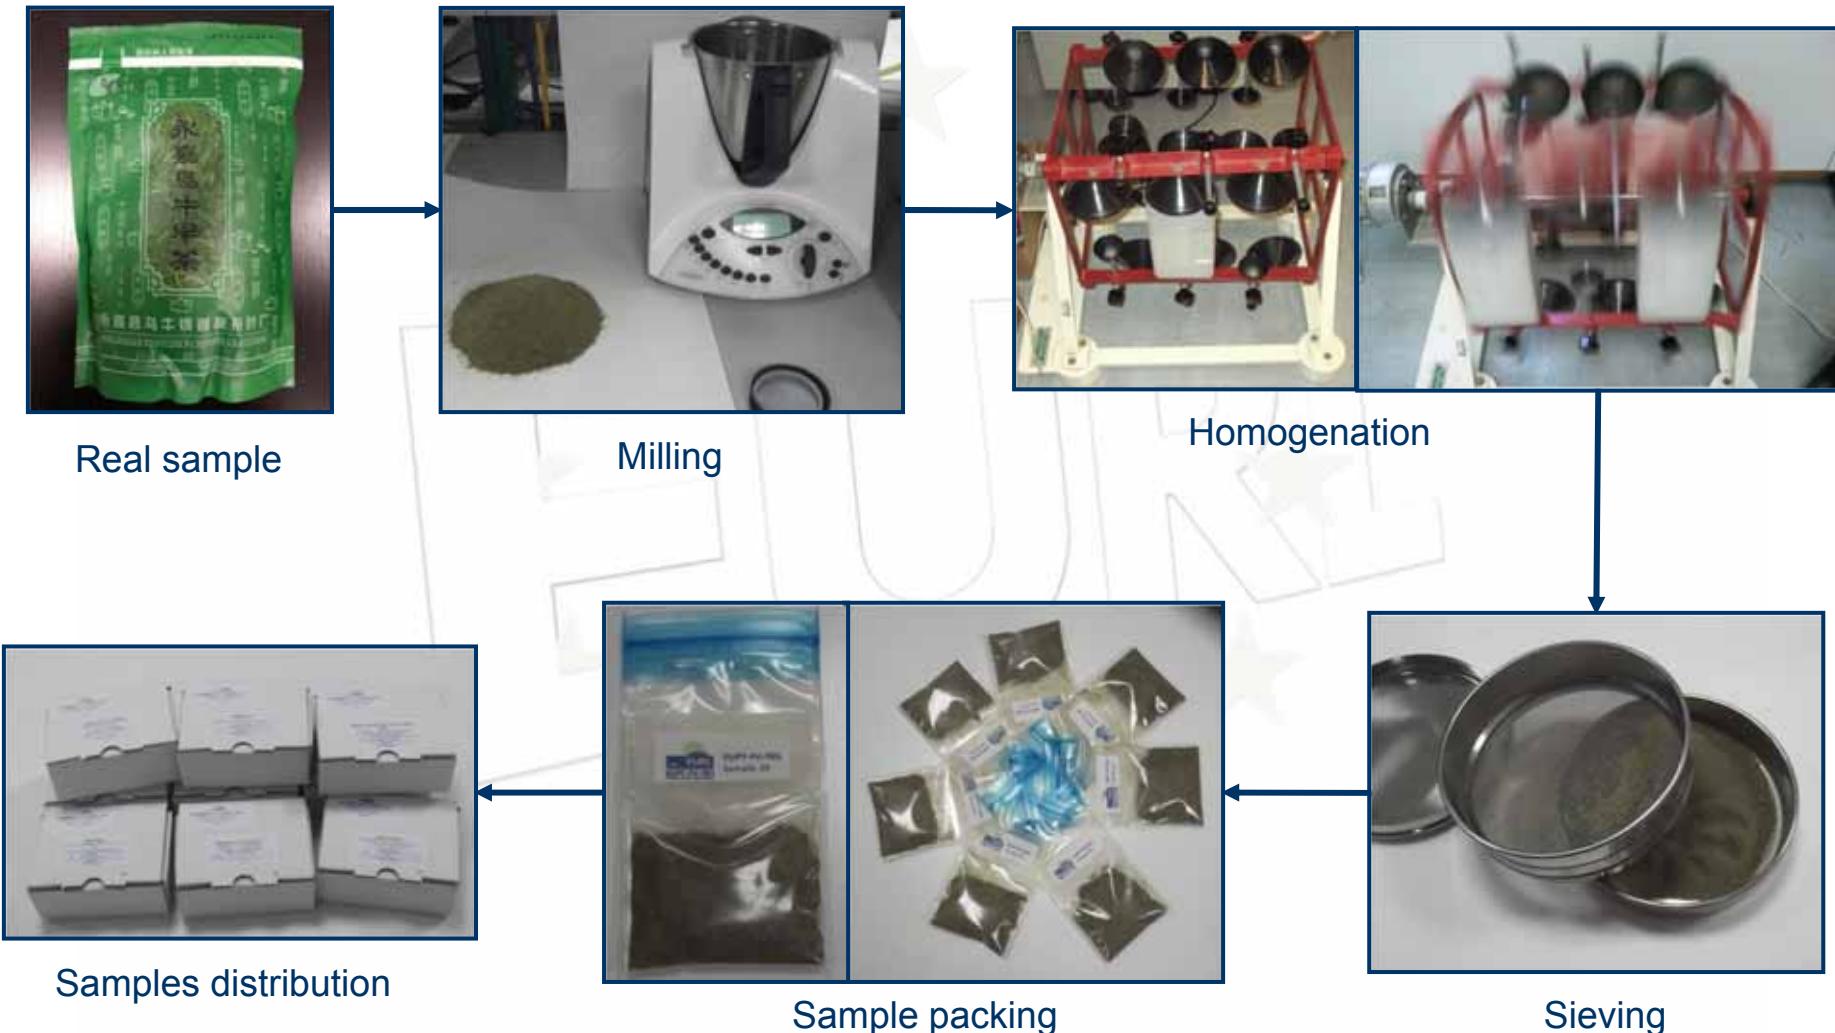

Not evaluated (Median < 4MRRL)

- Bifenthrin
- Endosulfan alpha
- Endosulfan sulphate
- Omethoate

Not evaluated (Homogeneity test fails)

- Thiophanate methyl

# Conclusions

# Conclusions

- Fifty-two laboratories participated in EUPT-T01 (Six from no EU or EFTA countries, 16 NRLs).
- Pesticides considered as positives were those which were reported by both the Organiser and the majority of participants.
- A higher dispersion (Qn) than in most fruits and vegetables have been observed (As maximum 44%).
- For carbendazim and thiophanate methyl, the results were influenced by the different degrees of degradation obtained by participants during the sample handling.
- QuEChERS without calcium chloride addition modification, presented a higher dispersion accounted as Qn than for the whole data reported (average Qn for QuEChERS was 41% whereas for the combined data, it was 34%).
- One compound did not pass the homogeneity test (thiophanate methyl). This fact is clearly as a consequence of some degradation to carbendazim.
- Overall, the results can be considered to be good with regard to the z-scores for each pesticide present in the test item, except for some pesticides which obtained a value more than 20% of unacceptable results (3 of them).
- It would appear that multiresidue methods such as QuEChERS have improved following modification ( $\text{CaCl}_2$  addition).
- All of the laboratories applying the miniLuke method obtained acceptable results in terms of z-scores, except for carbendazim.
