## 1. Aim and scope

This document reports the validation data for 178 pesticides included in the European Union Multi Annual Control Program (EU-MACP) [1] using a multiresidue method by LC-MS/MS and GC-MS/MS in chia seeds and Goji berries.

## 2. Short description

Homogenous samples were extracted using three different methods (QuEChERS, ethyl acetate, Mini Luke), which were adapted in the case of chia extractions. The obtained extracts were then analyzed by GC-MS/MS and LC-MS/MS.

These extracts were also analyzed by LC-TOF-MS. Matrix compounds were retrieved and counted using the Molecular Feature Extractor (MFE) algorithm in the MassHunter Workstation Software. The MFE creates a compound list of all the peaks in the data file that represent real molecules. At the end of the data process, a list with the mass, retention time and intensity of all matrix components was obtained. The resulting data was evaluated to get information of the complexity of the matrices through the number and distribution of matrix components.

## 3. Apparatus and consumables

- Automatic pipettes, suitable for handling volumes from 10 µL to 5000 µL and from 1 mL to 5 mL.
- Graduated 10 mL pipette.
- 50 mL and 15 mL PTFE centrifuge tubes.
- Homogenizer PolytronTM PT 10/35 GT.
- Vortex Shaker IKATM 4 Basic.
- Axial shaker Agytax SR1 CP57.
- Centrifuge Orto Alresa Consul 21, suitable for the centrifuge tubes employed in the procedure and capable of achieving at least 4000 rpm.
- Concentration workstation.
- Injection vials, 2 mL, suitable for LC and GC auto-sampler.

## 4. Chemicals

- Acetonitrile ultra-gradient grade
- Trisodium citrate dihydrate
- Disodium hydrogenocitrate sesquihydrate
- Sodium chloride

- Anhydrous magnesium sulphate
- Primary secondary amine (PSA)
- Petroleum ether
- Acetone
- Dichloromethane
- Supel QuE Z-Sep
- Ammonium formate
- Ultra-pure water
- Methanol HPLC grade
- Formic acid
- Ethyl acetate
- Pesticide standards

## 5. Procedure

### 5.1. Sample preparation

Following Document No. SANTE/2017/11813 [2], water was added to the chia seeds and Goji berries samples to improve the extraction efficiency of these low moisture commodities. In the case of chia seeds, water should not be added prior to the extraction procedure in order to avoid the appearance of a mucilage around the seeds [3]. Therefore, the extraction procedures were modified so that water could be added after the organic solvent. A grinding step was also included after water addition in order to open the seeds.

Goji berries can be hydrated prior to the extraction procedure. They were mixed with water and grinded to obtain a homogenate with a high water content. The weight proportion matrix-water (in grams) was 5:7.5.

### 5.2. Recovery experiments for method validation

Individual pesticide stock solutions (1000–2000 mg/L) were prepared in acetonitrile or ethyl acetate and were stored in screw-capped glass vials in the dark at -20 °C.

For spiking, representative portions of the previously homogenised sample were spiked homogenously with the appropriate amount of the working standard solution in acetonitrile. The validation methods were performed at two fortification levels (0.01 and 0.05 mg/kg). Three replicates were analysed at each level.

### 5.3. Extraction methods

### 5.3.1. Chia seeds

#### QuEChERS

1. Weigh 2 g of chia sample in a 50-mL PTFE centrifuge tube.
2. Add 10 mL acetonitrile and 10 mL H<sub>2</sub>O.
3. Mill the sample using a Polytron homogenizer for 30 sec.
4. Add 4 g anhydrous magnesium sulphate, 1 g sodium chloride, 1 g trisodium citrate dihydrate and 0.5 g disodium hydrogencitrate sesquihydrate.
5. Shake the sample in the Polytron homogenizer for 1 min.
6. Centrifuge the tubes at 4000 rpm for 5 min.
7. Transfer a 5-mL aliquot of the supernatant to a 15 mL PTFE tube containing 750 mg anhydrous magnesium sulphate and 175 mg Z-Sep.
8. Vortex the tubes for 30 sec.
9. Centrifuge at 4000 rpm for 5 min.

#### Mini Luke

1. Weigh 1.5 g of chia sample in a 50-mL PTFE centrifuge tube.
2. Add 10 mL acetone and 7.5 mL H<sub>2</sub>O.
3. Mill the sample using a Polytron homogenizer at 1500 rpm for 30 sec.
4. Add 3 g anhydrous magnesium sulphate.
5. Shake the sample in the Polytron homogenizer at 1500 rpm for 30 sec.
6. Add 10 mL petroleum ether and 5 mL dichloromethane.
7. Shake the sample in the Polytron homogenizer at 1500 rpm for 30 sec.
8. Centrifuge at 4000 rpm for 5 min.

#### Ethyl acetate method

1. Weigh 2 g of chia sample in a 50-mL PTFE centrifuge tube.
2. Add 10 mL ethyl acetate and 10 mL H<sub>2</sub>O.
3. Mill the sample using a Polytron homogenizer at 1500 rpm for 30 sec.
4. Add 8 g anhydrous magnesium sulphate and 1.5 g sodium chloride.
5. Shake the samples in an Agitax axial extractor for 15 min.
6. Centrifuge the tubes at 4000 rpm for 5 min.

### 5.3.2. Goji berries

#### QuEChERS

1. Weigh 12.5 g of Goji homogenate in a 50-mL PTFE centrifuge tube.
2. Add 10 mL acetonitrile.
3. Shake the samples in an Agitax axial extractor for 4 min.

4. Add 4 g anhydrous magnesium sulphate, 1 g sodium chloride, 1 g trisodium citrate dihydrate and 0.5 g disodium hydrogencitrate sesquihydrate.
5. Shake the samples in an Agitax axial extractor for 4 min.
6. Centrifuge at 4000 rpm for 5 min.
7. Transfer a 5-mL aliquot of the supernatant to a 15 mL PTFE tube containing 750 mg anhydrous magnesium sulphate and 125 mg PSA.
8. Vortex the tubes for 30 sec.
9. Centrifuge at 4000 rpm for 5 min.
10. Acidify with 10 µL formic acid 5 % per mL of extract.

#### *Mini Luke*

1. Weigh 9.4 g of Goji homogenate in a 50-mL PTFE centrifuge tube.
2. Add 10 mL acetone and 3 g anhydrous magnesium sulphate.
3. Shake the sample using a Polytron homogenizer at 1500 rpm for 30 sec.
4. Add 10 mL petroleum ether and 5 mL dichloromethane.
5. Shake the sample using a Polytron homogenizer at 1500 rpm for 30 sec.
6. Centrifuge at 4000 rpm for 3 min.

#### *EtAc*

1. Weigh 12.5 g of Goji homogenate in a 50-mL PTFE centrifuge tube.
2. Add 10 mL of ethyl acetate.
3. Shake the tubes manually for 3 sec.
4. Add 8 g anhydrous magnesium sulphate and 1.5 g sodium chloride.
5. Shake the samples in an Agitax axial extractor for 15 min.
6. Centrifuge the tubes at 4000 rpm for 5 min.

#### 5.4. Vial preparation

Extraction method	LC-QqQ-MS/MS	GC-QqQ-MS/MS
QuEChERS	5-fold dilution (ultrapure water)	Solvent change to ethyl acetate
Ethyl acetate	Solvent change to acetonitrile and 5-fold dilution (ultrapure water)	Direct injection
Mini Luke	3.3-fold concentration, solvent change to acetonitrile and 5-fold dilution (ultrapure water)	3.3-fold concentration and solvent change to ethyl acetate

During the vial preparation, dimethoate-d6 (LC) or lindane-d6 (GC) were added as internal standards.

#### 5.5. Methodology

Both LC and GC systems were operated in multiple reaction monitoring mode (MRM). Selected reaction monitoring (SRM) experiments were carried out to obtain the maximum sensitivity for the detection of the target molecules. For confirmation of the studied compounds, two SRM transitions and a correct ratio between the abundances of the two optimised SRM transitions (SRM2/SRM1) were used, along with retention time matching. The mass transitions used are presented in Appendix I (Table 1 for LC-MS/MS and Table 2 for GC-MS/MS parameters).

## 5.6. Instrumentation and analytical conditions for the LC- MS/MS system

### 5.6.1. 1290 UHPLC (Agilent)

- Column: Zorbax Eclipse Plus C8 2.1x100 mm and 1.8 µm particle size (Agilent)
- Mobile phase A: Water (0.1 % formic acid, 5 mM ammonium formate, 2 % MeOH)
- Mobile phase B: Methanol (0.1 % formic acid, 5 mM ammonium formate, 2 % water)
- Column temperature: 35 °C
- Flow rate: 0.3 mL/min
- Injection volume: 5 µL

Mobile phase gradient for pesticides analysis

Time [min]	Mobile phase A	Mobile phase B
0	100 %	0 %
2	80 %	20 %
15	0 %	100 %
18	0 %	100 %

Re-equilibration with initial mobile phase: 2.5 minutes.

### 5.6.2. 6490 triple quadrupole system (Agilent)

- Ionisation mode: Positive mode and negative mode
- Capillary (positive and negative): 3000 V
- Nebulizer: 45 psi
- Nozzle: 400 V
- Drying gas flow: 13 L/min

- Drying gas temperature: 120 °C
- Sheath gas flow: 10 L/min
- Sheath gas temperature: 375 °C
- High Pressure RF (positive): 150 V
- High Pressure RF (negative): 110 V
- Low Pressure RF (positive): 60 V
- Low Pressure RF (negative): 60 V

## 5.7. Instrumentation and analytical conditions for the GC- MS/MS system

### 5.7.1. Intuvo 9000 GC system (Agilent)

- Column: 2 Planar columns HP-5MS UI (15 m long × 0.25 mm i.d. × 0.25 µm film thickness)
- Injection mode: Splitless
- Ultra-inert inlet liner with a glass wool frit from Agilent
- Injection volume: 1 µl
- Injector temperature: 80 °C hold for 0.1 min, then up to 300 °C at 600 °C/min, hold for 5 min and then to 250 °C at 100 °C/min.
- Carrier gas: Helium at constant flow = 1.28 mL/min column 1, 1.48 mL/min column 2.
- Carrier gas purity: 99.999 %
- Oven temperature: 60 °C for 0.5 min, up to 170 °C at 80 °C/min, and up to 310 °C at 20 °C/min.

### 5.7.2. 7410 triple quadrupole system (Agilent)

- Ionisation mode: electron impact ionisation
- Temperature of the transfer line: 280 °C
- Temperature of ion source: 280 °C
- Collision gas: nitrogen
- Collision gas purity: 99.999 %
- Solvent delay: 2.6 minutes

## 5.8. Instrumentation and analytical conditions for the LC-TOF-MS

### 5.8.1. Agilent 1290 HPLC

- Column: Agilent Eclipse Plus Rapid Resolution HD C18, 2.1 mm x 50 mm x 1.8 µm
- Mobile phase A: Methanol 0.1 % Formic Acid, 2 % ultrapure water, 5 mM ammonium formate
- Mobile phase B: 0.1 % Formic acid in ultrapure water, 2 % methanol, 5 mM ammonium formate
- Flow rate: 0.3 mL/min
- Injection volume: 4 µL

Mobile phase gradient

Time [min]	Mobile phase A	Mobile phase B
0	20 %	80 %
2	20 %	80 %
15	100 %	0 %
17	100 %	0 %

Re-equilibration with initial mobile phase: 2.5 minutes.

### 5.8.2. Agilent 6550 LC-QTOF-MS

- 4 GHz High Resolution Mode
- ESI source gas temperature: 160 °C
- Gas flow: 14 L/min
- Nebuliser gas and collision gas: nitrogen
- Nebuliser gas pressure: 30 psi
- Sheath gas flow: 12 L/min
- Sheath gas temperature: 350 °C
- Ionisation mode: positive
- Capillary voltage: 4000 V
- OctopoleRFPeak 750V
- Fragmentor 360 V

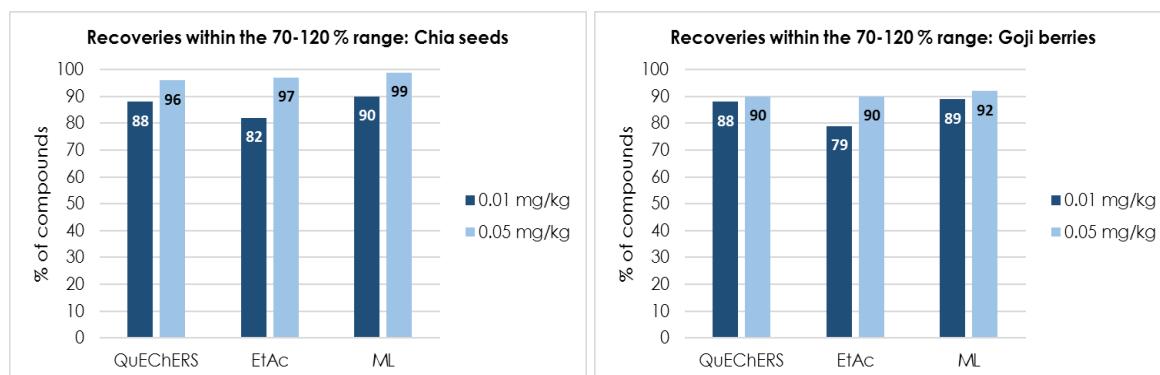

## 6. Results

## 6.1. Validation of the methods

### 6.1.1. Recoveries and within-laboratory reproducibility

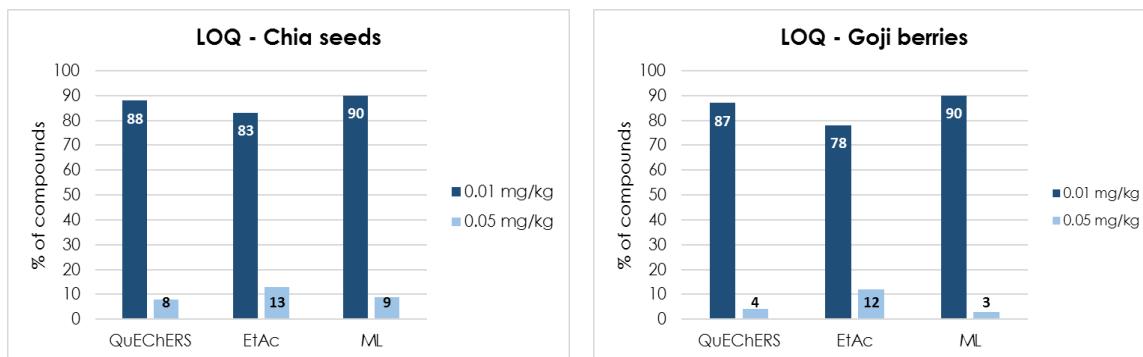

The results corresponding to the mean recovery ( $n=5$ ) and within-laboratory reproducibility in terms of relative standard deviation ( $RSD_r$ ) at two fortification levels (0.01 and 0.05 mg/kg) are summarized in Appendix II, Table 3, Table 4 and Table 5.

Most recovery results are within the range 70-120%. The following graphs summarize the results obtained:

### 6.1.2. Limits of quantification

Document N° SANTE/2017/11813 defines limit of quantitation as the lowest validated spike level meeting the method performance acceptability criteria. LOQs are detailed in Appendix II, Table 6 and Table 7. The results were as follows:

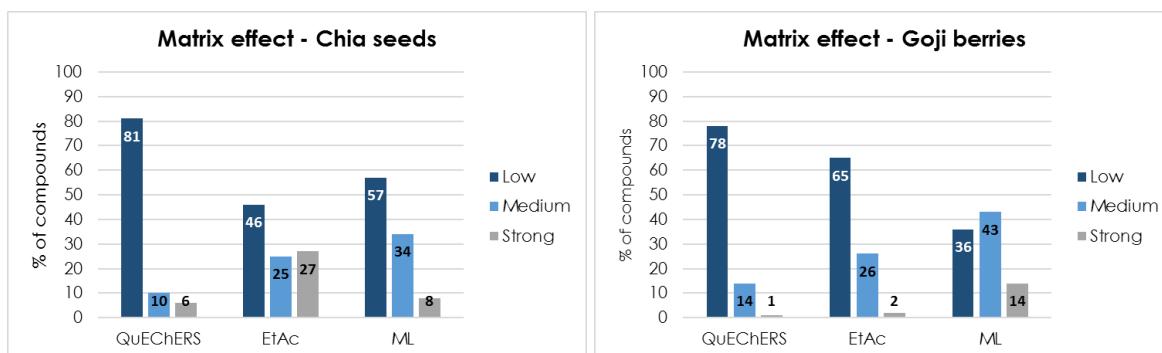

### 6.1.3. Linearity

Linearity of the MS/MS systems was evaluated by assessing the signal responses of the target analytes from matrix-matched calibration solutions prepared by spiking blank extracts at six concentration levels, from 0.001 to 0.100 mg/L. In all cases, the coefficient of determination ( $R^2$ ) was higher than 0.99, except for dithianon. Linearity ranges for all pesticides are summarized in Appendix II, Table 6 and Table 7.

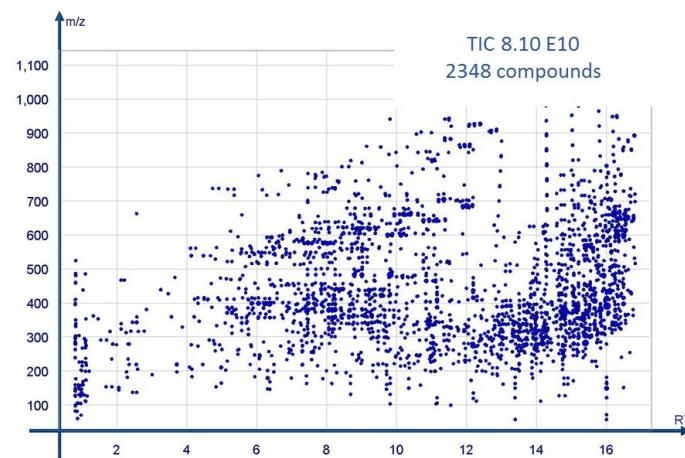

### 6.1.4. Matrix effects

Matrix effects were assessed by comparison of the slopes of six-point matrix-matched calibration curves with the slopes of the calibration curves in solvent (LC) or in tomato (GC). For values (in absolute terms) between 0 and 20 %, there is a low matrix effect; between 20 % and 50 % there is a moderate matrix effect, and for compounds with a value over 50 % there is a strong matrix effect. These values of matrix effects are summarized in Appendix II, Table 6 and Table 7, and they are also represented in the following graphs:

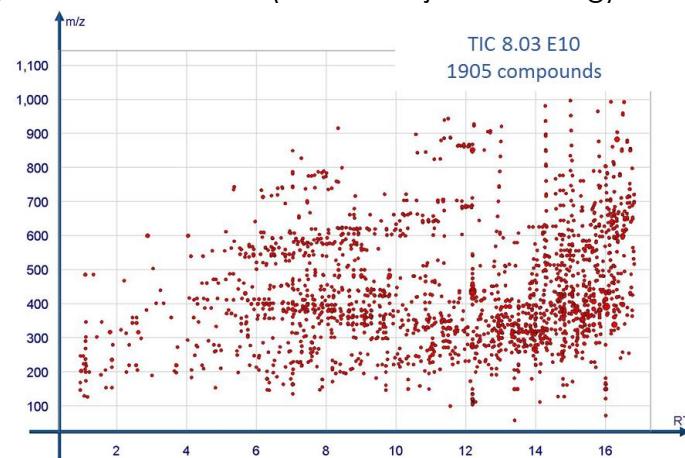

## 6.2. LC-TOF-MS background distribution

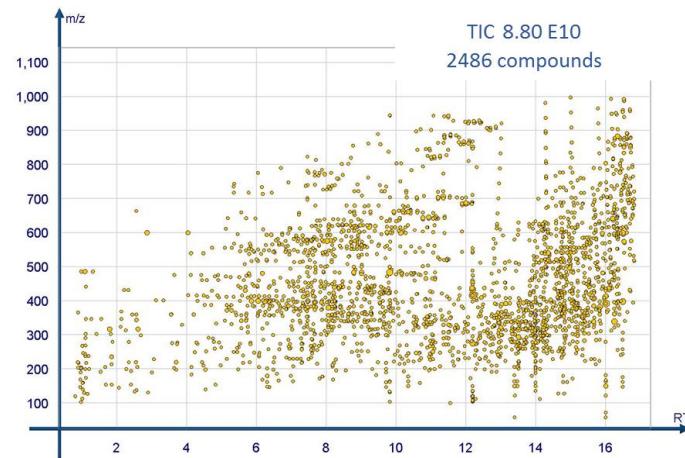

- a) Number and distribution of co-extracted matrix components of chia seeds using QuEChERS method (amount injected: 1 mg)

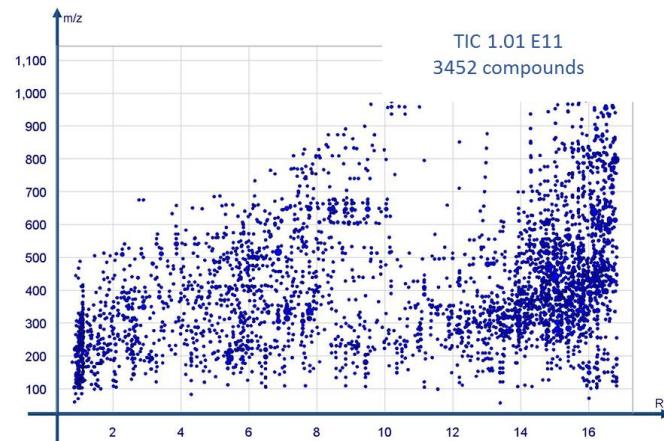

- b) Number and distribution of co-extracted matrix components of chia seeds using ethyl acetate method (amount injected: 1 mg)

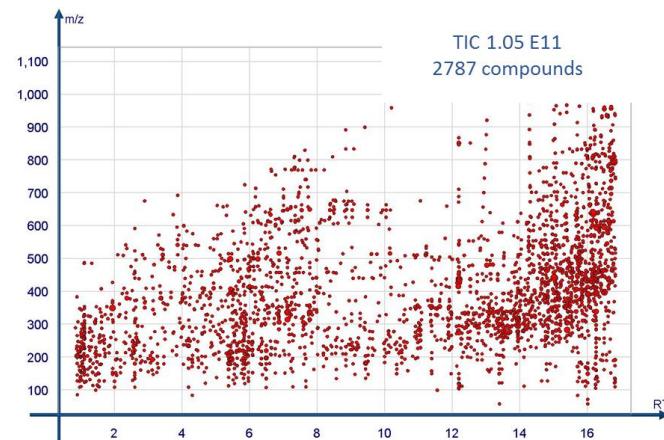

- c) Number and distribution of co-extracted matrix components of chia seeds using Mini Luke method (amount injected: 1 mg)

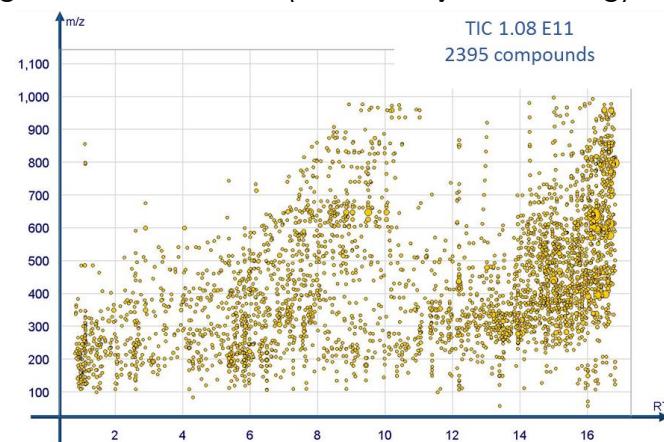

- d) Number and distribution of co-extracted matrix components of Goji berries seeds using QuEChERS method (amount injected: 1 mg)

- e) Number and distribution of co-extracted matrix components of Goji berries seeds using ethyl acetate method (amount injected: 1 mg)

- f) Number and distribution of co-extracted matrix components of Goji berries seeds using Mini Luke method (amount injected: 1 mg)

**LOQ:** limit of quantification

**R:** correlation coefficient

**NA:** Not analysed (present in the sample)

**N.F.R.:** Not fulfilling requirements for quantitative method (Recovery < 30 % and/or R.S.D. > 20 %)

**Q.C.:** QuEChERS

**Ac.:** Ethyl acetate

**LC:** Liquid chromatography coupled to tandem mass spectrometry

**GC:** Gas chromatography coupled to tandem mass spectrometry

**Table 7.** Limits of quantification, linearity range, coefficient of determination and matrix effects for the selected matrices studied and the Mini Luke method. Negative values of matrix effects mean suppression of the signal, and positive values, enhancement.

No.	Compound	LOQ (mg/kg)		Linear range (mg/kg)		R <sup>2</sup>		Matrix effect (%)		Method
