1. Pesticide scope

The list Target pesticides list. The list is divided into two pages. The voluntary pesticides are at the end of the list on the second page. Remember to save each page before continuing to the next page or the previous page.

It is possible for you to mark or remove all marks for the fields 'Analysed for', 'Within routine scope' and 'Accredited'. If you mark all pesticides you can remove individual marks for pesticides that you e.g. do not analyse for.

Please enter also about your reporting level for the pesticide you detected in the Test Items. The reporting level must be entered with a point as decimal mark and no units, for instance 0.02 but not 0,02 mg/kg.

This page has a new feature.

Use the edit button to get display all fields for one pesticide.

Welcome: JOHN.DOE@TEST.NU Logout

EU Reference Laboratories for Residues of Pesticides

Results, EUPT-CF10

Lab code:
Contact name: John Doe

Remember to save your data before you leave the page

Use the **edit button** to get display all fields for one pesticide. Fields marked with * are mandatory – you have to enter a value.

Please enter your results of the pesticide residue levels in the Test Items (materials) as you would routinely report them (i.e. report the recovery-corrected result, if this reflects your normal procedure). Please enter only numbers with decimal points as decimal mark and no units, for instance 0.251 but not 0,251 mg. If the results are = 0.010 mg/kg, the results must be reported with to three significant figures, e.g. 0.0123, 0.123, 1.23. If the result is < 0.010, use only two significant figures e.g. 0.0092 mg/kg. Do not enter any letter or symbols like >, <, +, -, =.

The **ion ratio** of the calibration standard should be at a concentration level close to the concentration level in your sample. Likewise, the **retention time** of the calibration standard should be from a concentration level close to the level in your sample.

IMPORTANT: If your result is not correctly expressed it will be considered as not analysed.

100%

If your software does not automatically calculate the ion ratio, then you can calculate the ion ratio as the response of the:

least abundance ion
most abundance ion

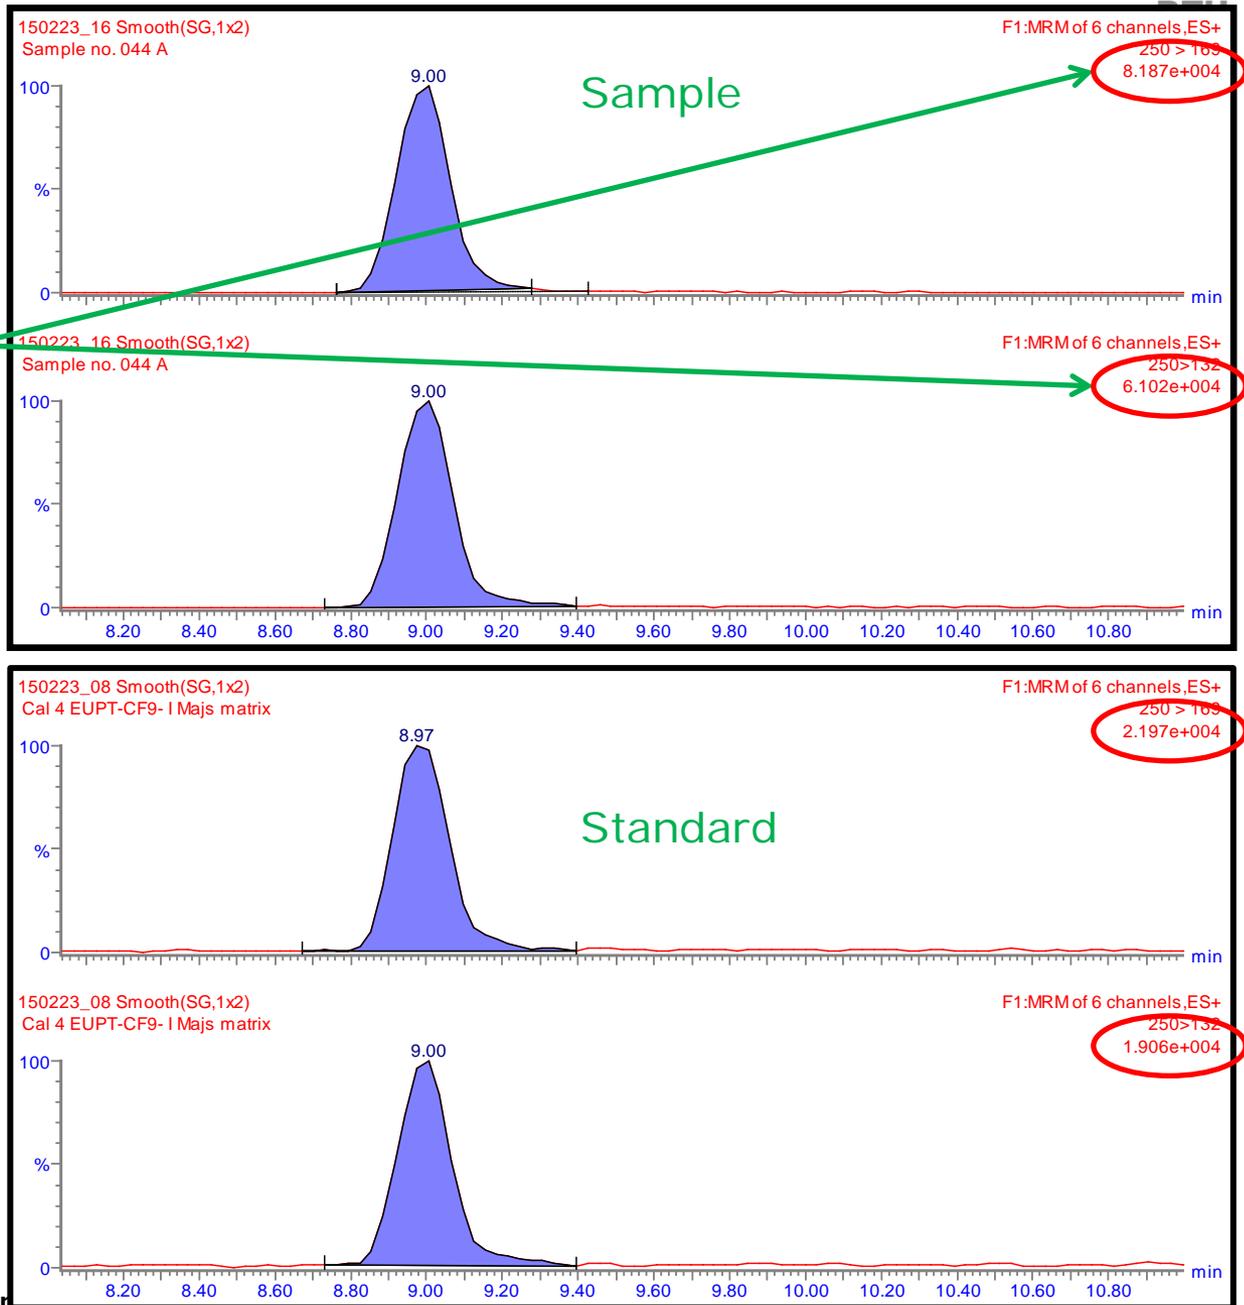

The figures should be <1

Calculate for both sample and standard.

In this example the ion ratio for the sample is: 0.74 and for the standard: 0.87

The standard you use should be close in concentration to the samples

The retention time for the sample and standard. In this example 9.00 and 8.97

3. Method

This page has a new feature.

Use the edit button to get display all fields for one pesticide.

Lab code:
Contact name: John Doe

Remember to save your data before you leave the page

Use the **edit button** to display all fields for one individual pesticide. Fields marked with * are mandatory – you have to enter a value.

Please, specify the methods used for the pesticide listed below. The pesticides are identical to the pesticides you have reported as detected in the sample on subpage 1. Pesticide scope.

If you have described your method for one pesticide (source) and the same method is used for other pesticides (targets), you don't need to enter all the details again. In the field "Method as" simply write the number of the source pesticide, where details of the method are already given. When you save the page, the method details will be copied from the source to the target pesticides. If the method is nearly the same as for a previous pesticide, start to copy all the fields as just described. After the page is saved, update the methods where needed and save again.

[home](#) [cancel](#) [save](#)
